Introducing LinuxBlock WebHost.

With the advent of the internet and the proliferation of web based businesses, having an online presence has become very important for success in virtually any form of endeavour. The advantage created by business process reengineering through the web, has made it possible for business to be done and even consummated without the physical interaction of the buyers and sellers.

According to Netcraft's survey there are currently about 108 million websites on the worldwide web with a worldwide Monthly growth of nearly three million websites. Showing the indisputable relevance of websites in our current information age. There are websites for online dating, schooling, religious devotion and even gaming indicating that the vast range of possibilities are yet to be fully explored.

Basically web sites are hosted or housed in web servers and the successful delivery of requested sites on your browser is made possible by several technologies.

A Domain Name: This is a dot com, dot net or dot org address that is relevant to the Company name or Services rendered by it. The more popular and mentally impressionable your web address the better.

Domain Name Server: This can be easily described as the phone book for the Internet, by translating human friendly computer domain names into IP Addresses.

The HTTP Server: This is a computer program which is responsible for accepting HTTP requests from web clients which are also known as web browsers and serving them HTTP responses along with optional data contents, which usually are web pages such as HTML documents and linked objects (images, etc.).

When you pay for a web server basically what you pay for is the HTTP Server, as a matter of choice, taking into cognizance the various technologies available for the purpose of webhosting. The two most popular are the APACHE and the Internet Information Service (IIS) servers. The latter ships with Windows NT Server products while the other comes with your Linux Server.

Based on comparison they both operate well under the toughest web based conditions however the APACHE server is the better and more used of two. Being able to run applications developed across several platforms and also delivers top behavior. By analysis from Netcraft, 50.43% of applications developed on the World Wide Web are done on the LINUX APACHE Platform while 34.44% are done on the WINDOWS IIS platform.

With these points in mind LinuxBlock is privileged to introduce her vast array of web hosting services.

Domain names and their cost implications –

Service	TLD & Duration	Cost
Domain Name Registration	Dot Com x 1yr	=N=2,500
	Dot Net x 1yr	=N=2,500
	Dot Org x 1yr	=N=2,500
	Dot Co dot UK x 2yrs	=N=8,000
	Dot Name x 1yr	=N=2,500
	Dot Info x 2yrs	=N=4,000
	Dot Biz x 2yrs	=N=4,000
	Dot CC x 1yr	=N=5,500
	Dot TV x 1yr	=N=5,500

Shared hosting packages and their cost implications –

Server Features	Ruby Host	Silver Host	Gold Host
Yearly Cost	N5,500	N12,500	N20,000
Storage	1gig	500gig	Unlimited
Bandwidth	10gig	50gig	Unlimited
